While discussing transmitter and receiver circuitry we did not have to know much about antennas or propagation. It sufficed to know only that a voltage applied to the terminals of a transmitting antenna causes a proportional voltage to appear very shortly thereafter at the terminals of a

One of the key areas of any radio system is that part where the signal is transferred from the transmitter to the receiver. This involves the use of antennas or aerials to radiate the signal as an electromagnetic wave, and then there is the way that the electromagnetic wave travels or propagates between the transmitting antenna and the receiving one. Thus antennas and

Sky waves are reflections from the ionosphere also known as ionospheric propagation. Radio signals are affected in many ways through which they travel.

Reflection, refraction and diffraction may occur. Sky wave signals are radiated by the antenna into the upper atmosphere, where they are reflected in the ionosphere and sent back to earth.

Fundamentals of Propagation

When a suitable antenna is driven by a radio transmitter it radiates energy into free space in the form of Electromagnetic (EM) Waves. EM waves are produced by a complex mechanism. In close vicinity to the antenna (within  $1/2\lambda$  to  $1\lambda$ ), the energy field is called induction field.
