MOTION. • An important concept is that all motion is relative. When we say that something has a given velocity, that velocity is relative to something else (these are called reference frames). A car traveling to the east at 55 mph is doing so relative to Earth.

Kinematics is the study of how objects move. Armed with data on an object's position at every point in time, we can go on to determine its velocity and acceleration as well.

## Kinematics in One Dimension

Kinematics analyzes the positions and motions of objects as a function of time, without regard to the causes of motion. It involves the relationships between the quantities displacement ( $d$ ), velocity ( $v$ ), acceleration ( $a$ ), and time ( $t$ ). The first three of these quantities are vectors.
